

For collaborative iac development and delivery we need to share the terraform configuration file along with state file across the devops engineers who are working on the project so that they can develop and manage the infrastructure.
How to share or collaborate the terraform configuration file and tfstate file?
terraform configuration file can be pushed into version control system repository like GIT (terraform project), so that it can be distributed across the developers of the team and can work in parallel.
Can we even push the terraform statefile into repository and distribute across the members of the team?
